**Keywords** : Augmented Reality, Data Glasses, Industrial Application, Requirements

### **Abstract**

The first industrial applications with Augmented Reality are set into operation. The automotive industry uses this technology to increase the efficiency and quality of their processes and products. The application used at first Monitor AR or Projection AR due to the fact, that available data glasses did not show the required characteristics. The applications demonstrated the positive effects of Augmented Reality within the industry.

The properties of actual data glasses improved but they are not sufficient for the different industrial applications. The industrial experience is the base for the requirement for the future data glasses.
